

CAC MEETING DISCUSSION QUESTIONS

Trigger Point Injections Questions for Subject Matter Expert Panel

Please limit discussion to what is supported by evidence for the following questions. This discussion will be limited to trigger points and will not include Botox or nerve injections.

- 1. Do you agree with the following definitions (and if not, how would you define)?
- Trigger point a hyperirritable spot in skeletal muscle that is associated with a hypersensitive palpable nodule in a taut band and frequently associated with referred pain.
- Trigger point injection an invasive procedure where medication is injected directly into a trigger point.
- Dry needling an invasive procedure where a small needle to penetrate a trigger point in an area of a muscle without any injection of a medication.
- Nerve block an invasive procedure where medication is injected directly into (e.g., neurolysis) or around a nerve.
- Fibromyalgia a chronic condition which presents with tender points and widespread pain with the development of peripheral and central sensitization.
- Myofascial pain syndrome a chronic pain disorder characterized by myofascial trigger points with the development of peripheral and central sensitization.
- Tendon sheath injection an invasive procedure where medication is injected into a tendon sheath.
- Acupuncture placement of thin needles into strategic points in treat pain and disease without injection of a medication.
- 2. Do you agree clinical history and physical exam requires: a taut band, a hypersensitive sport and/or nodule, and referred pain to diagnose trigger points?
- 3. What injectant should be used during trigger point injections? Is there any evidence to guide the type of injectant used and if a combination (such as local anesthetic alone or in combination with steroids) is more effective?
- 4. What is the expected duration of relief from trigger point injections? Does it vary with the agent used or the underlying disease process?
- 5. What assessment should be done before and after trigger point injections?
- 6. What percent improvement is considered a positive response? What criteria should be met to consider repeating injections? What evidence or societal guidance supports this?

- 7. Is there evidence for or guidance on repeating the injection to the same area? If yes, how frequently should trigger point injections be performed?
- 8. Is there a limit to how many trigger point injections can be performed during the same session? What evidence or societal guidance supports this?
- 9. For what duration should trigger point injections be utilized? What evidence or societal guidance supports this?
- 10. Do you agree trigger point injections should be performed as sole procedure and not in conjunction with other procedures during the same session? Please explain why?
- 11. Are the circumstances where image guidance is necessary for trigger point injections?
- 12. What are absolute contraindications are there for trigger point injections?
- 13. Rate the strength of evidence to support the effectiveness of Trigger Point Injections to relieve pain for the following conditions using very insufficient, low, moderate, or high quality to describe supporting evidence:
 - a. Myofascial pain disorders
 - b. Chronic low back pain
 - c. Migraine/other headache disorders
 - d. Non-radicular neck pain
 - e. Anterior cutaneous nerve entrapment syndrome
 - f. Chronic pain syndrome
 - g. Fibromyalgia
 - h. Neuropathic pain
 - i. Non-malignant musculoskeletal pain
 - j. Lumbosacral canal stenosis
 - k. Cancer pain
 - I. Hemiplegic shoulder pain
 - m. Pelvic floor myalgia/sexual pain
 - n. Others

| Grade |
|-------|
|-------|

| High | We are very confident that the estimate of effect lies close to the true effect for this outcome. The body of evidence has few or no deficiencies. We believe that the findings are stable, i.e., another study would not change the conclusions |
|--------------|---|
| Moderate | We are moderately confident that the estimate of effect lies close to the true effect for this outcome. The body of evidence has some deficiencies. We believe that the findings are likely to be stable, but some doubt remains. |
| Low | We have limited confidence that the estimate of effect lies close to the true effect for this outcome. The body of evidence has major or numerous deficiencies (or both). We believe that additional evidence is needed before concluding either that the findings are stable or that the estimate of effect is close to the true effect. |
| Insufficient | We have no evidence, we are unable to estimate an effect, or we have no confidence in the estimate of effect for this outcome. No evidence is available, or the body of evidence has unacceptable deficiencies, precluding reaching a conclusion. |
